

Plan For Website & Mobile App Development

Tech Stack -

Backend - Laravel

Database - Mysql & MongoDB

Websockets - [node.js](https://node.js.org/)

Website frontend - core php

Mobileapp - flutter

Workflow for admin -

1. Admin can add edit & delete the products & their categories
2. Admin can manage the rental duration & rental prices for every product
3. Admin can manage the membership plans for users & limit's extension
4. Users, orders, blogs, frontend for website, livetime order tracking (if possible via logistics partner api's integration), city management (add edit & delete activate & deactivate the business locations)
5. Enquiries, rental bookings, product return tracking & duration extension

Frontend workflow -

Users will login using their mobile number complete their profile, check their memberships are active or not & purchase the membership to rent out the products otherwise users can directly purchase the products, check order history & latest made orders, update their profile, helpline portal will also there so users can raise their support queries & complaints (ticket system will get implemented here)

Mobile app - same as our website flow but have extra featured like payment follow up notifications, newly added products notifications, membership cards like bajaj finance,

Tools will be going to use in flutter - google firebase fcm with onesignal for notifications, google places api to fetch out locations (future implementation plan after 1st update on playstore), pusher beams & containers for ticketing system & future live chat sockets implementation on product details page, [leaflet.js](https://leafletjs.com/) for pinpoint mapping with flutter local notifications or awesome notifications like plugins to send automated payment followups

Optional but high costed api (vapi agentic ai calling) - for payment & product return reminder our ai agents will make follow up calls to our customers
